Math 108-01
Cryptology
CRN# 22459
TR 9:30 am to 10:45 am
Kennedy 208

Instructor:	Dr. Christopher Seaton
Office:	320 Ohlendorf Hall
Office Hours:	M 3:00pm—4:00pm
	W 2:00pm—3:00pm
	TR 11:00am—12:15pm *or by appointment*
Phone:	x3721
E-mail:	seatonc@rhodes.edu
Web:	http://faculty.rhodes.edu/seaton/
Text:	T. Barr: **Invitation to Cryptology**, Prentice Hall, 2002

Course Description:

The purpose of this course is to examine selected classical and modern methods of message encryption, decryption, and cryptanalysis. In this context, we will develop and use a variety of mathematical tools to describe and study the methods: modular arithmetic, probability, matrix arithmetic, number theory, Boolean functions, and complexity theory.

In governments, military organizations, banks, commercial concerns, industries, and ordinary life, there is often a need to communicate where the medium is insecure. Discussions between an ambassador and his or her home government officials about diplomatic strategies may need to be kept from another government with which the ambassador is carrying on negotiations. Orders about battlefield tactics from a central command to soldiers should not fall into the hands of the enemy. A transmission from an automatic teller machine to the bank's main office containing a patron's account and balance information should not be readable by thieves. An on-line retailer (or a customer) does not want the credit card numbers of people ordering its products to be obtained by thieves. A company transmitting sensitive or proprietary information among its offices in geographically diverse locations does not want its trade secrets to land in the hands of its competitors. Two individuals corresponding by email may not want their communications to be readable by packet sniffers. These are some of the basic and direct application areas for **cryptography,** the science and art of secret writing.

On the other hand, law enforcement may be monitoring encrypted communications among suspected criminals. The military of one country may be gathering transmissions between an enemy state and its allies or between the state and its armed forces in the field in an attempt to read them and improve their own strategic effectiveness. Turning such "scrambled" communications into comprehensible messages is the process of **cryptanalysis,** which can be a difficult undertaking and one that can be aided by mathematical techniques.

To understand the effectiveness of a cryptographic method, a designer or user of the method not only needs to be able to carry through the steps of encryption and decryption accurately and efficiently, but he or she needs to play the role of cryptanalyst on the

method. So the activities of cryptography and cryptanalysis are intimately related; together they are often referred to as **cryptology**.

Content:
We will at least cover Chapters 1 and 2, Sections 3.1—3, and Sections 4.1, 4.3, and 4.4. Time permitting, we may cover additional sections of Chapters 3 and 4.

Prerequisites:
This course assumes minimal background and is appropriate for Rhodes students who have not taken other math courses after high school.

Office Hours:
Students are **strongly** encouraged to take advantage of my office hours and make appointments at other times. My schedule is at
http://faculty.rhodes.edu/seaton/schedule.htm.
Please consult this schedule before suggesting an appointment time (particularly via e-mail).

Skype:
When I am not in my office but am working somewhere else, I am frequently logged into Skype and listed as available. Students are welcome to add me as a contact on Skype in order to ask questions about the material at these times. Skype is free and easy to install, so please to contact me if you have any questions about setting it up.

Web-Page:
This syllabus is available on my web-page (URL above). I will post a summary of homework assignments there as well. In addition, I will occasionally use files in class which will be made available in my public folder on the Rhodes academic fileserver. I will announce anything I post in class, but students are encouraged to consult my web page and public folder on the fileserver, particularly if they have missed a class.
The homework summary is for your reference when preparing for class or studying for an exam. It is subject to change until the assignments have been given in class.

Attendance Policy:
I will take attendance. You are permitted **two** unexcused absences throughout the semester; if you are absent two or fewer times, you will be allowed to skip one problem on the final for which you will receive full credit (one tenth of the test). An excused absence must be discussed with me **in advance if possible**, and the proper documentation must be made available where appropriate. If I decide that excessive absences are jeopardizing your ability to pass the course, I will take action as outlined in the catalogue. It is your responsibility to obtain notes and assignments when you are absent.

Grading:

Your letter grade for the course will be based on the following scale:

A	[93, 100]	B-	[80, 83)	D+	[67, 70)
A-	[90, 93)	C+	[77, 80)	D	[63, 67)
B+	[87, 90)	C	[73, 77)	D-	[60, 63)
B	[83, 87)	C-	[70, 73)	F	[0, 60)

This scale is "worst case scenario"; I may choose to uniformly reduce the numerical requirements for a grade, but will not increase them.

The total percentage will be computed as follows:
Homework:	25%
Quizzes:	10%
Exams:	$2 \times 20\%$
Final Exam:	25%

Homework:

At the end of each lecture, I will assign both practice problems for you to test your comprehension and homework problems to be handed in. Much of what you learn in this course will be the result of working exercises from the text. These are designed to reinforce key concepts, so keeping up with and doing the assignments is essential to success. The amount of time needed to do homework may vary considerably from assignment to assignment and from student to student. It is not unreasonable to spend **two or three hours** on many of these assignments, so it is incumbent upon you to allocate time in your schedule for the purpose of doing mathematics homework.

The homework from each week is due **in class** the second lecture day of the following week, usually a Thursday (modifications will be announced in the case of a holiday or test week). The homework you hand in must be your own work; you may work on the problems with other students, but they **may not aide in the write-up**.

Late homework will only be accepted with my approval and will be penalized 50%.

Quizzes:

At the beginning of most lectures, a short quiz will be given on the reading assignment for that lecture. These quizzes will not assume that you have mastered the material, but will test your familiarity with the reading.

Tests:

There will be two tests during the semester. They will be given **in Kennedy 201 from 7:00pm to 8:30pm on Thursday, February 16th and Thursday, March 29th.** If you need to reschedule a test, you **must** make arrangements with me as early as possible **before** the day of the test, and you will be expected to document your absence. Otherwise, you will not be allowed to make up the test. **In most circumstances, I will not make arrangements for you to make up a test unless I have been notified one week before the day of the exam.**

Final Exam:

The final exam is scheduled on Wednesday, May 2nd at 1pm. It will be a closed-book, closed-notes, cumulative exam. Students who have reason to reschedule the final exam should make arrangements with me at least one week in advance.

Math Support Center:

The Math Support Center is a resource for students located on the third floor of Ohlendorf. A tutor will be assigned to this class and will hold regular drop-in tutoring hours one or two nights a week; you are welcome to come by during these times for additional assistance on homework or other questions about the material. Our tutor and the schedule of tutoring hours will be announced as soon as this information becomes available.

Calculators:

I will allow the use of calculators on the exams, including the final, **for basic arithmetic**. You may not use your calculator to store any information, and **you may not use a cell phone as a calculator**. I will require you to show your work on homework and exams for full credit.

Honor Code:

All students are expected to conduct themselves within the guidelines of the College's Honor Code. Please ask me if you have any questions about what is allowed. I reserve the right to reduce a student's grade in the event of plagiarism whose intent cannot be verified.

Students with Disabilities:

If you have or think you may have a documented disability, please contact me and the Office of Student Disability Services as early in the semester as possible.
