Text: Goldstein, et. al.: **Brief Calculus and its Applications**

Course Description:

This is a one-semester introduction to differentiation and integration from the perspective of applied mathematics, as well as the many applications of these ideas in the physical, life, and social sciences. While most of this course is devoted to calculus of functions of a single independent variable, some attention is paid to functions of several variables. The goals of this class include learning the mechanics and formalism of differential and integral calculus; however, our primary goal is that you to learn how to apply the mathematics of calculus to model physical phenomena and solve related problems.

The field of Applied Mathematics is very different from the mathematics you may have studied in other courses. Though there will be some overlap, **this course will have little in common with a high school calculus class.** By its very nature, Applied Mathematics cannot be learned by doing drill exercises from a textbook, or by using pencil and paper to solve problems; applied mathematicians are interested in being able to understand and perform direct computations that arise in applications, not artificial problems used to illustrate ideas. For this reason, this course will involve using the software package *Mathematica*. **Learning to use such a software package is a major part of learning Applied Mathematics.** *Mathematica* is not to be considered a tool to learn the “book” material; rather, it is a way of doing mathematics. The **primary** objective of this course is that you learn this way of doing mathematics. For this reason, you are strongly encouraged to seriously approach learning *Mathematica* as a major goal for this course.

Content:

The content of this course will be divided among five modules. Three of these modules will introduce the material through a number of related applications and will emphasize using the **concepts** and **technology** to model data. The other two modules, the “theory modules,” are brief excursions designed to develop technical skills.

Course Prerequisites:

The prerequisite for this course is a solid background in high school algebra and geometry. It is designed for students encountering calculus for the first time. **If there is any chance that you may take calculus beyond the introductory level, then you should take Math 121 instead;** Math 115 is **not** designed to prepare you for later calculus courses. **You cannot earn credit for Math 115 after taking Math 121.**

Office Hours:

You are strongly encouraged to take advantage of my office hours and make appointments at other times.

Moodle:

This syllabus, as well as our other course materials, is available on Moodle. You will be required to log into Moodle and use it extensively over the semester to view course materials and hand in assignments.

Attendance Policy:

You are required to attend **each class**, a **weekly tutorial** (most weeks), and **one workshop**. Though this class meets “officially” three times a week, your attendance in tutorial meetings and the workshop is required. Your attendance record will be a component of your final grade (see below).

Mathematica workshops will be held on Wednesday, January 21st and Thursday, 22nd from 6pm-8pm in the Barrett computer labs. You are required to attend ONE of these workshops. Optional workshops will be scheduled on Wednesday, January 28th and Thursday, January 29th at the same times. These optional workshops will give you an opportunity to seek extra help with *Mathematica*.

Grading:

Your letter grade for the course will be based on a scale at least as generous as the following:

A	[93, 100]	B-	[80, 83)	D+	[67, 70)
A-	[90, 93)	C+	[77, 80)	D	[63, 67)
B+	[87, 90)	C	[73, 77)	D-	[60, 63)
B	[83, 87)	C-	[70, 73)	F	[0, 60)

The total percentage will be computed as follows:

Module 1	20%
Module 2	10%
Module 3	20%
Module 4	20%
Module 5	10%
Final Exam	20%

Each module will be assessed based on the following:

- Attendance: 10%
Includes attendance in class, weekly tutorials, and a workshop on *Mathematica*.
- Homework, Quizzes, Tasks: 50%
Includes assignments from the text, assignments given from the lecture, and in-class quizzes, as well as “tasks”; see notes on homework below.
- Final Assessment: 40%
The final assessment will be different for each module. For modules 1, 3, and 4, it will be a group project such as a written project or presentation; your grade will have both a group and individual component.
For modules 2 and 5, it will be an individual test.

The final exam will be a comprehensive written exam.

Homework:

Your homework assignments will include a number of “traditional” assignments from the text, as well as additional tasks you will be required to complete in order to learn *Mathematica*, organize with your tutorial groups, etc. Many of the tasks you will be asked to complete will be graded “credit or no credit” and will be worth 10-50% of a standard homework assignment. Homework is due at the beginning of class or at the submission deadline posted on Moodle.

Late work will only be accepted according to the policy on Make-Up Exams and Extensions (see next page).

Group Work:

This course has a large group work component. See the document “Description of Tutorial Groups” for more information on this component.

Exams:

The final assessment for Modules 2 and 5 will be in-class exams. They are tentatively scheduled for Friday, February 27th and Friday, April 24th. If you have to be to be absent for an exam, you should make arrangements with me as early as possible before the day of the exam. Again, see the policy on make-up exams on the next page.

Final Exam:

The final exam is scheduled for Wednesday, May 6th at 1:00pm. It will be a closed-book, closed-notes, cumulative exam. Additionally, there will be a take-home portion of the final exam which you will take using the software package *Mathematica*.

Calculators and *Mathematica*:

You may use calculators on homework and exams, including the final, for arithmetic operations only. You may not use your calculator to store any formulas or notes, and you will be expected to show your work on homework and exams for full credit. Many of your homework and group projects will require the use of the software package *Mathematica*. Workshops on *Mathematica* will be held on the second week of classes; you are required to attend one of these workshops with your group.

Math Support Center:

The Math Support Center is a resource for students located on the third floor of Ohlendorf. Tutors at the support center will be available as a resource to you. Your group will be assigned to a specific tutor who will work closely with your group. These tutors will also help assess your group projects by commenting on the participation of each member of the group; note that they will not grade your work. The drop-in hours for this course will be announced during the first two weeks of the semester.

Honor Code:

All students are expected to conduct themselves within the guidelines of the College's Honor Code. Please ask me if you have any questions about what is allowed.

Make-up Exams and Extensions on Assignments

Extensions on the due dates of assignments and individual re-scheduling of exams will be granted only for the following reasons:

- Serious and verifiable illness or medical emergency
- Participation in an *official* Rhodes College activity (e.g., course field trip, sports team travel)
- Religious holidays
- Major life event (such as birth, wedding, death) – your own or a close family member
- Other genuine emergency that is beyond your control

Notice that this is an extensive list. It does not, however, include situations in which the timing of an exam or assignment is simply inconvenient for you. In particular, there will be no accommodation for ordinary travel arrangements before or after college breaks.

If you wish to request an extension or re-scheduling because of a situation which can be known ahead of time, it is your responsibility to make arrangements in advance. Permission might not be given after the fact. You may be asked to make your request in writing.

In all cases, your instructor is the final judge of whether an accommodation is warranted.

Description of Tutorial Groups
(Appendix to Syllabus)

What is a Tutorial Group?

A tutorial group will be a group of five students who work together as a study group, under the guidance of a tutor.

What work will I do with the Tutorial Group?

The most significant task that the group will do is prepare the final projects for Modules 1, 3 and 4. There will, however, be other group tasks to complete; these tasks will help you understand the contents of the lectures more thoroughly.

Do I have to attend Tutorials?

Yes, with the exception of those tutorial meetings listed as “optional.” There is an attendance grade for each Module and a tutorial counts the same as a lecture.

How long are Tutorials?

A tutorial should not last for longer than 50 minutes.

Module 1: Task 1

Log in to Moodle and visit this course before 5:00pm on Friday, January 16th.

Module 1: Task 2

Form a group of five people **who have similar schedules**. Each person from the group should enter the list of names of the five students in the group on Moodle under Task 2. This should be done before 5:00pm on Wednesday, January 21st.

Module 1: Task 3

On Thursday, January 22nd, your professor will e-mail you with the name and contact details of the tutor for your group. The group should meet with their tutor and arrange a time when you can all meet for **weekly** tutorials.

Note: Each Module has a homework grade, and your completion of each task will count as a portion of one homework assignment. Your task grades in this module are “credit/no-credit.”
